

Saber tooth tiger

By: Bennet

Body

Saber tooth tigers are large prehistoric mammals. They could grow up to 3 feet tall. They had 2 long sharp teeth that could grow up to be 8 inches long. In the back of the tooth is jagged like a knife.

Habitat

The saber tooth tigers lived 1 million years ago. They lived in small groups in the forests and grasslands of north and South America.

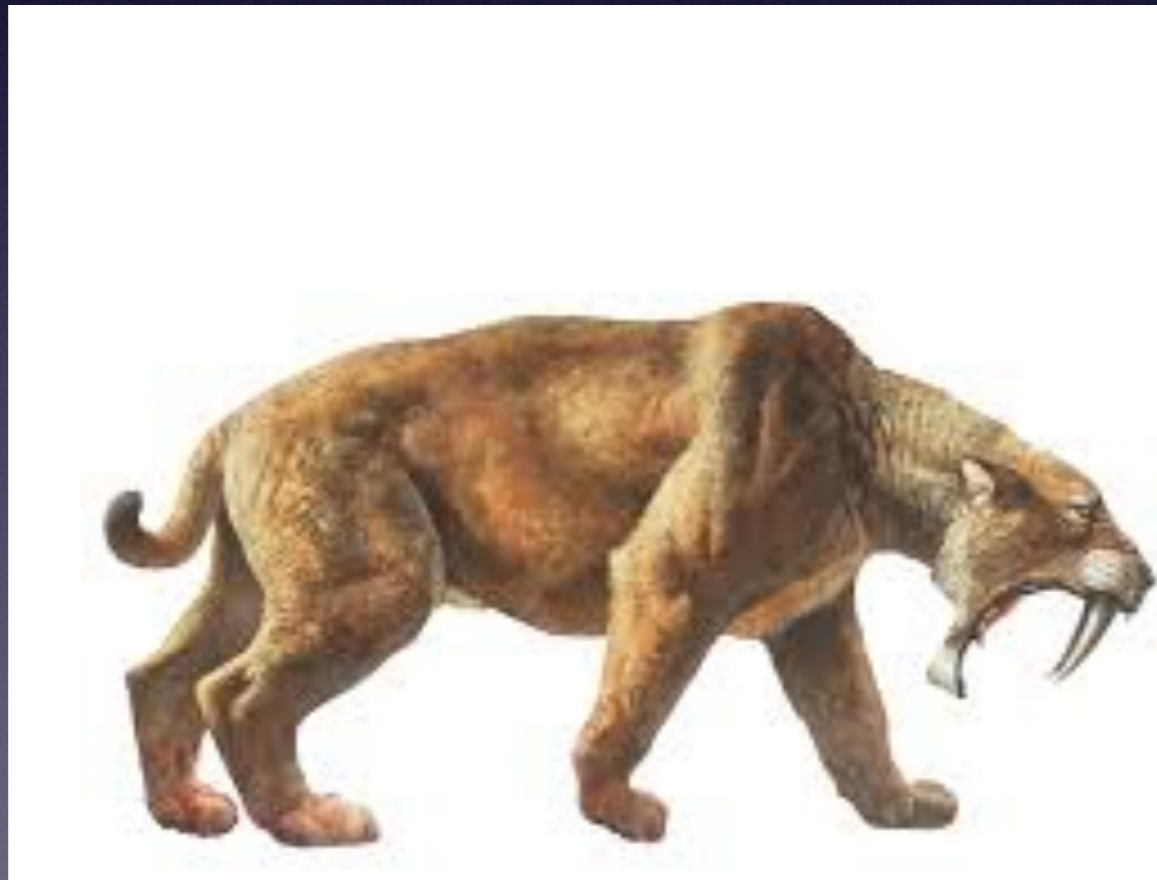

Food

Saber tooth tigers probably ate large, thick skinned animals like elephants, mastodons and ground sloths.

Behavior

Saber tooth tigers spent a lot of time hunting. they couldn't run long distances, so they snuck up on prey.

Fun facts

Did you know that the saber tooth tigers teeth were the size of bananas? Mabel those cave men dudes played a prank on another cave man dude using yellow spray paint and saber tooth tiger teeth. The saber tooth tiger is named after its teeth. That's kinda obvious because it has the word tooth in its name, but I just thought I'd tell you. Also, the saber tooth tigers teeth are shaped like sabers, a curved sword. Saber tooth tigers are apart of 2 family's/ groups. One is the normal cat family/ group , felidae. The other is extinct.
